CIS 4400 [FTA 34788] Data Warehousing for Analytics

Dr. Isaac Vaghefi

11/21/2021

Introduction (Issues/Problems)

Living in the city, parking has always been an issue for all New Yorkers, for drivers and non-drivers. There are problems with accidents, parking tickets, and parking violations. With the introduction of coronavirus in early 2020, there has been an increase in these issues because of space allocated for outdoor dining. There have also been debates on how NYC should be handling the lack of parking spots and how they can better allocate the use of space to solve these issues¹.

To find a solution to the reason for these main issues we are using the “311 Service Requests from 2010 to Present” data set as the primary data set to focus on the issue of illegal parking. With the second and third data set, “Open Parking and Camera Violations” and “Local Law 8 of 2020 – Complaints of Illegal Parking of Vehicles Operated on Behalf of the City”, to filter more specifically the types of violations, the fine amount, and the specific locations of violation. The core of our problem will be to find a correlation between the introduction of sidewalk cafes and illegal parking. The data set “Sidewalk Cafe Licenses and Applications” would give us an insight to the amount of sidewalk cafes opening up in the city, the amount of space they are occupying, as well as, the allowed space they are allowed to occupy by regulations of the DCA (Department of Consumers Affairs). All data sets are from NYC Open Data.

¹ Rosa, Amanda. “Yes, Parking in New York Has Gotten Worse.” *The New York Times*, The New York Times, 6 Jan. 2021, <https://www.nytimes.com/2021/01/06/nyregion/nyc-parking.html>.

KPIs (Key Performance Indicators)

- Rate of incoming parking violations for the last 5 years (2016 - 2021).
- Count of parking violations by type for each borough
- Average fine amount by year
- Average amount of violations by time period (AM/PM)
- Popularity of different violation per borough
- Percent increase of square feet occupation of sidewalk cafes by borough for the last 5 years (2016-2021)
- Average of square feet occupied by sidewalk cafes.
- Correlation of sidewalk cafes and parking violations/complaints by zip code and borough

Dimensional Modeling Draft

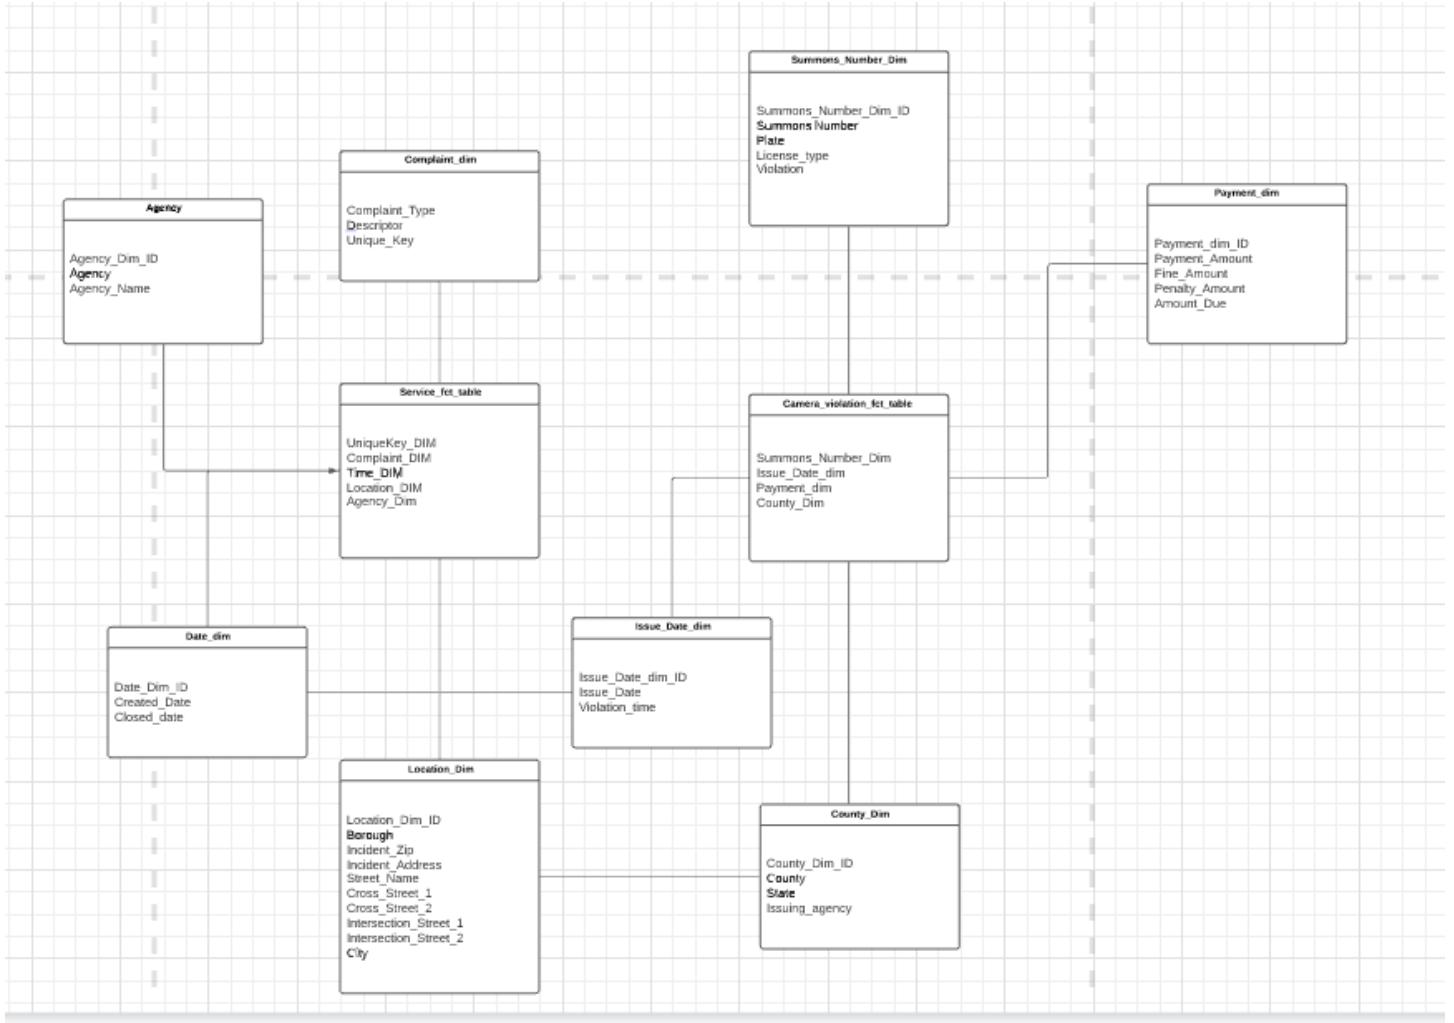

Figure 1. Parking Violations and Sidewalk Cafes Data Dimensional Model (First Draft)

Using the “311 service request from 2010 to present” and “open parking and camera violations” dataset, we created a dimensional model with the idea of using date and location dimensions to connect the two datasets. We decided to select a monthly grain to achieve a better understanding of parking violations on a month to month basis.

Finalized Dimensional Model

Parking Violations/Complaints and Sidewalk Cafes Data

Dimensional Model

Authors: Prakhyat Rana, Melissa Ramirez Nunez, William Zhu

Date: 11/06/2021

Course: CIS 4400

Professor: Dr. Isaac Vaghefi

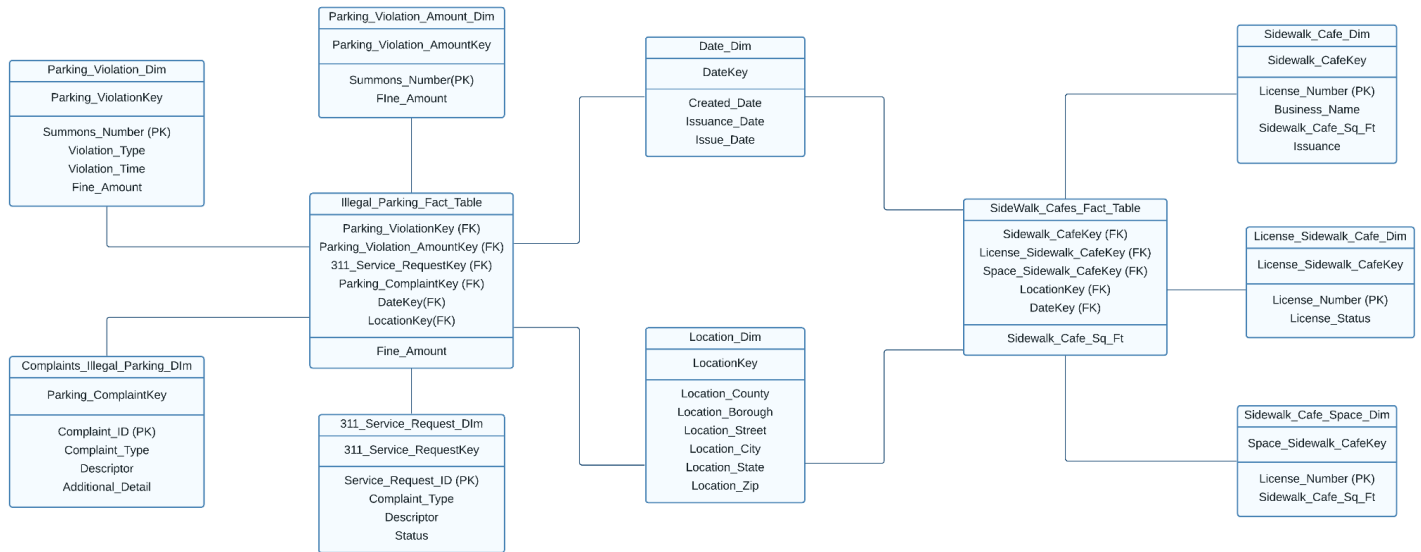

Figure 2. Parking Violations/ Complaints and Sidewalk Cafes Data Dimensional Model (Final Model)

[Link to Dimensional Model via LucidChart](#)

From our previous draft, we decided to include 2 more data sets “Sidewalk Cafe Licenses and Applications” and “Local Law 8 of 2020 – Complaints of Illegal Parking of Vehicles Operated on Behalf of the City”. We modified our KPI’s to include average square feet, percent increase of square feet occupation, and correlation of sidewalk cafes to parking violations and parking complaints. To connect the two fact tables, we used the date and location dimensions. We decided to select a monthly grain to achieve a better understanding of parking violations and parking complaints on a month to month basis.

ETL Transfer Plan Using Pentaho Software

We plan on using Pentaho Software for our ETL process. Using the CSV file input feature, we will transfer the data into Pentaho and filter out null entries using SQL in the filter rows function. We will place null entries into a text file and no instances of null entries into a Microsoft Excel output. We will then continue to clean our data by making sure there are no repeated entries by using unique rows. After that, we will plan on editing some of our metadata using select values and finally using table output to open a connection to Google BigQuery.

ETL Process

To transform our public datasets and use it in the project, we performed the following:

- Used Input Functions in Pentaho to load “Sidewalk Cafe Licenses and Applications”, “Local Law 8 of 2020 – Complaints of Illegal Parking of Vehicles Operated on Behalf of the City”, “311 Service Requests from 2010 to Present”, and “Open Parking and Camera Violations” CSV files.
- Reviewed the files, made adjustments to several columns and removed unnecessary ones.
- Renamed the important columns using the “Select Values” and “Renaming Fields” tool.
- Identified field names and field types by filtering out rows for each of them.
- Filtered all rows to remove null values.
- Used all the borough locations as a mainstream field to match with our Excel file using the “Fuzzy Match” tool for data set “Local Law 8 of 2020 – Complaints of Illegal Parking of Vehicles Operated on Behalf of the City”.
- Filtered out null entries for “311 Service Requests from 2010 to Present” and “Open Parking and Camera Violations” data sets, however the size of these files were extremely large and took us several minutes to run.

Figure 14. Example of Accurate Excel File for Matching Field Name "County"

ETL Transformations Summary

We used an “Excel Input” to enter our datasets and auto-filled fields. We then removed unnecessary fields in our dataset, represented in figure 4. In our next step of our cleaning process we removed null entries into a text file and kept valid entries in an Excel sheet. We accomplished this by using the “Unique Row” function and provided the SQL code as ‘not null values’, as shown in figure 6, and results are shown in figure 7. We changed the metadata field names to match the ones in our dimensional model for easier interpretation. Furthermore, in our efforts to clean data we removed duplicate records and sorted our primary keys in ascending order. Sample of final preview shown in figure 11. We repeated these steps for all datasets. Excluding data set “Open Parking and Camera Violations” which includes a transformation to match field “County” with accurate metadata. This was completed using the tool “Fuzzy Match” and connecting with an outside Excel file to match the metadata respectively to their best match. This transformation step is shown in figures 12, 13, and 14. We waited several hours for Pentaho to run its transformation and decided that writing SQL code would be faster. It was fairly simple code, I selected a distinct Complaint_ID/Summons number, renamed my fields to match our dimensional model, and made sure there were no null values figure 15. The only real issue we encountered was trying to convert ‘county’ into ‘boroughs’ to have a consistent location type through all our datasets.

Here we see that Queens has the highest number of complaints as well as Illegal parking according to the donut chart. We can also conclude that June/July have the highest count of violation by month which is most noticeable in queens.

```
SELECT avg([Sidewalk_Cafe_Sq_Ft]) as Avg_sidewalk_sqft
FROM `cis-4400-homework-classwork.Group6Project.sidewalk` LIMIT 1000
```

Row	Avg_sidewalk_sqft
1	251.983870967742

We found out that the average space sidewalk-cafe's occupy is 251.98 square feet. To put that into perspective, the minimum space for a parking space is 9ft wide and 18ft long which is about 162 square ft

Final thoughts on the project

b) the group's experience with the project (which steps were the most difficult? Which were the easiest?

what did you learn that you did not imagine you would have? if you had to do it all over again, what would you have done differently?)

This project helped us put into perspective how large a dataset can really be. The most difficult part was the wait time needed to run a transformation in Pentaho. This was difficult because one step took more than five hours and we had to terminate it because it was no longer a feasible idea. Instead we turned to google BigQuery for the ETL process which was significantly faster than Pentaho. However, there were data type issues that we've come across such as DateTime. One of the easiest parts of this project was setting up Pentaho for ETL. It proves itself to be extremely user friendly and maps out the ETL process. If we had to do this project all over again, we would definitely choose less datasets as adding two more became twice as confusing. One thing I learned that was unexpected was creating a dashboard from my current dataset/queries. It's a painless transition to the final step of this project that didn't require uploading all the datasets again.

a) the software and database tools the group used to coordinate and manage the project as well as carry out the programming tasks (list of bullet points with software or service and one sentence of what it was used for)

- Google docs- shared view/edit allowed all of us to contribute to a different part of the project proposal at once
- Whatsapp- used for communicating availabilities and issues with our project
- Lucid chart- Used for Dimensional modeling.
- Pentaho- initially used for ETL.
- Google BigQuery- Running SQL code for ETL.
- Data Studio- used for data visualization.

Meeting Logs:

Date & Time: 09/26 (10:30 PM - 12 AM)

Attendees: Melissa Ramirez, Prakhyat Rana

Discussion: Project ideas, choosing between the issue of animal abuse and illegal parking.

Date & Time: 09/27 (10:30 PM - 11:30 PM)

Attendees: Melissa Ramirez, Prakhyat Rana

Discussion: Finalization of the project proposal.

Date & Time: 10/10 (10:00 PM - 11:30 PM)

Attendees: William Zhu

Discussion: Dimensional modeling

Date & Time: 10/17 (4:00 PM - 5:30 PM)

Attendees: Melissa Ramirez, William Zhu

Discussion: Editing project proposal.

Date & Time: 11/03 (11:00 PM - 12:30 AM)

Attendees: Melissa Ramirez, William Zhu, Prakhyat Rana

Discussion: Editing dimensional modeling and deciding DBMS for data warehousing.

Date & Time: 11/06 (6:00 PM - 7:00 PM)

Attendees: Melissa Ramirez, William Zhu, Prakhyat Rana

Discussion: Finalizing dimensional model

Date & Time: 11/18 (5:00 PM - 7:00 PM)

Attendees: Melissa Ramirez, William Zhu, Prakhyat Rana

Discussion: Starting ETL

Date & Time: 11/20 (4:30 PM - 7:00 PM, 11:00 PM - 1:00 AM)

Attendees: Melissa Ramirez, William Zhu, Prakhyat Rana

Discussion: Finalizing ETL

Date & Time: 12/5

Attendees: William Zhu, Prakhyat Rana

Discussion: Looking for an alternative ETL process since pentaho takes a lot of time.

Date & Time: 12/6 - 12/7

Attendees: William Zhu, Prakhyat Rana

Discussion: Data visualization and presentation preparation.
